## SELECTION OF BEARING TYPE

### Selection of bearing type according to the direction and magnitude of loads

The magnitude and direction of loads greatly influence the selection of bearings. Generally, for the same dimensions, the cylindrical roller bearing stands heavy loads than the deep groove balls bearing. The bearings with more rows of rolling elements, especially rollers have heavy load carrying capacity.

According to the load acting direction, the following situation are distinguished:

a) Radial load

Cylindrical roller bearings without ribs at one of the rings, with one row of rollers (type N or NU) or with two rows of rollers (type NN or NNU) and needle roller bearings are to be used.

b) Axial load

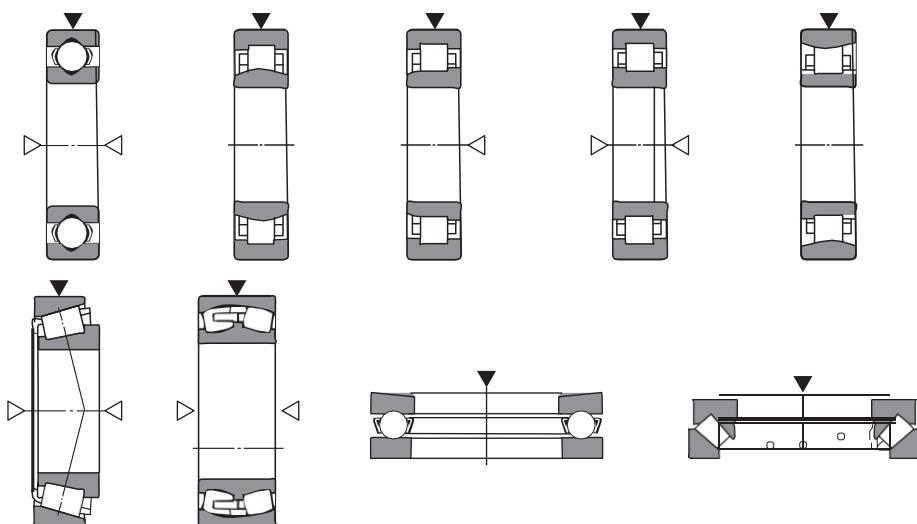

Thrust balls or roller bearings according to the load magnitude, are to be used. The simple effect thrust roller bearings can be loaded only in a single direction and the double effect thrust roller bearings can be loaded in both directions.

c) Combined load

The simultaneous action of radial and axial load means that on the roller bearing acts a combined load.

For light axial loads together with radial loads are used:

- Deep groove ball bearings, single row. (Combined load supported rises if the radial clearance is greater than normal);
- Cylindrical roller bearings of the NUP and NJ+HJ types and spherical roller bearings.
- NJ type cylindrical roller bearings can only accommodate axial loads acting in a single direction and for axial displacement of the shaft in both directions it is recommended to mount roller bearings of the same type.

# BEARING TYPES

Bearing types and their characteristics

Suitable / Very good

Good

Normal / Possible

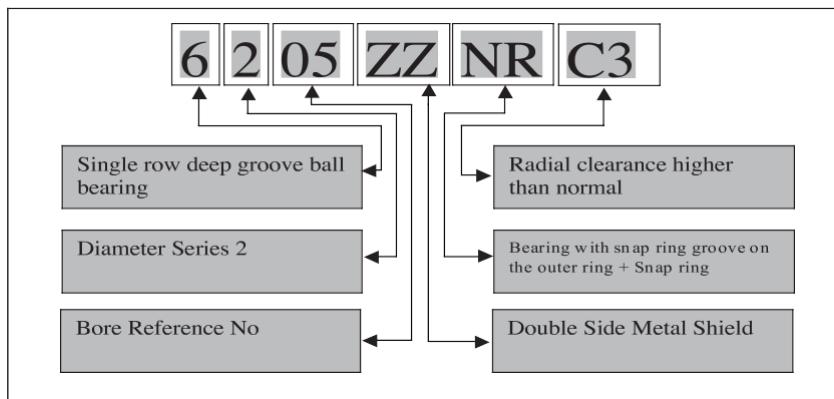

Limited

Not suitable / Not Applicable

Bearing Type	Characteristics									
	Radial loadability	Axial loadability in both directions	Length compensation within the bearing	Length compensation with sliding fit	Separable bearings	Compensation of misalignment	Increased precision	Suitability for high speeds	Quite running	Tapered bore
Deep groove ball bearings										
Angular contact ball bearings										
Angular contact ball bearings double row										
Self-aligning ball bearings										
Cylindrical roller bearings NU,N										
Cylindrical roller bearings NJ										
Cylindrical roller bearings NUP										
Tapered roller bearings										
Spherical roller bearings										
Thrust ball bearings										
Spherical roller thrust bearings										

← Single bearings and bearings in tandem arrangement in single direction, a) for paired mounting, b) for low axial load, c) limited suitability for paired mounting  
d) also with adapter or withdrawal sleeves, e) very good for narrow series, f) S-type bearings and thrust ball bearings with seating washer compensate for misalignment during mounting

## PREFIXES AND SUFFIXES

### Prefixes

EE	Miniature and small size ball bearing
F	Flanged outer ring (for ball bearing)
H	Adapter Metric Size
HC	Hi- Cap
HCLM	Hi- Cap Light medium inch series taper roller bearing
HCTR	Hi- Cap Single row taper roller bearing non standard direction
HM	Heavy medium Duty inch series taper roller bearing
JL	J series taper roller bearing
L	Light Duty inch series taper roller bearing
LM	Light medium Duty inch series taper roller bearing
M	Medium Duty inch series taper roller bearing
N	N type Cylindrical roller bearing
NJ	NJ type Cylindrical roller bearing
NU	NU type Cylindrical roller bearing
NUP	NUP type Cylindrical roller bearing(inner ring loose rib)
RLS	Inch Size Ball Bearing
RMS	Inch Size Ball Bearing
W	Wide width type bearing

### Suffixes

B	40 Degree contact angle for angular contact ball bearing
BEP	40 Degree contact angle for angular contact ball bearing with reinforced polyamide cage
C	15 Degree contact angle for angular contact ball bearing
C2	Radial internal clearance less than normal
C3	Radial internal clearance more than normal
C4	Radial internal clearance more than C3
D	Steep contact angle ( $24^\circ\text{--}32^\circ$ ), for metric series ball bearing
EMQV2	Electric Motor Quality bearing with Vibration standard V2
JR	Tapered roller bearings, whose cup width , contact angle and cup small inside diameter conforms to ISO standard with high load carrying capacity
K	Tapered bore , 1/12
K30	Tapered bore , 1/30
M	Machined Brass cage
N	Bearing with Snap ring groove
NR	Bearing with Snap ring groove and a locating snap ring
RS	Rubber seal on one side of the bearing
2RS	Rubber seal on both the side of the bearing
W33	With three oil holes and oil grooves on outer ring for spherical roller bearing
Z	Metal shield on one side of the bearing
ZN	Metal shield on one side of the bearing and Snap ring groove
ZNR	Metal shield on one side of the bearing and Snap ring groove with a snap ring
ZZ	Metal shield on both the side of the bearing

## BEARING INTERNAL CLEARANCE

### *Radial Internal Clearance of Deep Groove Ball Bearing (Cylindrical bore)*

Nominal bore Diameter d, mm	over up to	Clearance (microns)					
		C2		CN		C3	
		min.	max.	min.	max.	min.	max.
2.5	6	0	7	2	13	8	23
6	10	0	7	2	13	8	23
10	18	0	9	3	18	11	25
18	24	0	10	5	20	13	28
24	30	1	11	5	20	13	28

# BEARING MATERIALS

## *Race way and rolling element materials*

While the contact surface of a bearing's raceway and rolling elements are subjected to repeated heavy stress they still must maintain precision and rotational accuracy. To accomplish this, the raceways and rolling elements must be made of a material, which has high hardness, resistance to fatigue, wear resistance and good dimensional stability.

In case of normal applications and operating conditions, a low alloy chromium steel proved to be particularly suitable for rolling bearings.

Through-hardenings steels of same or similar compositions are predominantly used worldwide by most of the manufacturers of rolling bearings. And the most commonly used steel is SAE 52100 and the hardness maintained is 58~63 HRC

## ***Standard material used in various countries for normal applications***

Country	ISO	USA	Germany	Japan	China
Bearing steel	683	SAE52100	100Cr6	SUJ2	GCr15

## ***Cage materials***

Bearing cages have high importance in bearing. The main property of a cage is keeping the rolling element at equal distance, separate the neighboring rolling element from colliding with each other and to keep the friction and heat development at a minimum.

## ***Type of cages used***

- Pressed CRCA (cold rolled cold annealed) sheet strip are used in manufacturing of cages for small and normal application bearings
- Polyamide cages (Glass fiber reinforced polyamide 6.6) are used for small and medium size bearings, due its properties of low density, high elasticity, low wear at sliding movement and low inertia movement, this type of cage has a maximum operating temperature of +120°C
- Machine steel and brass cages are generally used for large-size bearings

# LUBRICATION

The main purpose of a lubricant is to prevent direct metallic contact between various rolling and sliding element. This is achieved through a thin layer of film created by the lubricant supplied (grease or oil) on the contact surfaces

The following are the advantage of a lubricant

- Reduce in friction and wear
- Heat dissipation due to friction
- Increased bearing life
- Prevention against rust

To achieve the above effect , the best of the lubrication system is to be selected

Generally lubrication is classified in to

- Grease
- Oil
- Solid Lubricant ( $\text{MoS}_2$ )

The amount of grease to be applied on a single bearing is calculated as below for a best performance of a bearing

Quantity to be applied (m) =  $D \times B \times 0.01$  (grams)

If the bearing is re-lubricated after operation the amount depends on the re-lubricating interval

Quantity to be applied (m) =  $D \times B \times R$  (grams)

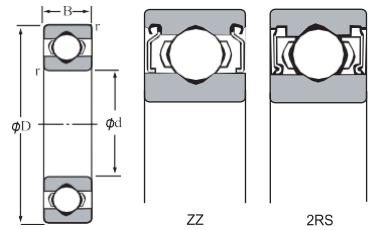

Where D= bearing outside dia 10 mm, B= bearing width in mm

R= to be taken as 0.002 for weekly re-lubrication, 0.003 for monthly re-lubrication and 0.003 for yearly re-lubrication

***The most commonly used commercial grease with their brand names and properties are given below***

Rotational speed limits shown applicable for machined cage bearings only.

Rotational speed limits of pressed cage bearings to be kept under 80% of this value.

This speed limit is in case of 15° contact angle is applicable for bearings higher than class 5, Suffix B indicates the contact angle is 40°, Suffix C indicates the contact angle is 30° and no suffix indicates the contact angle is 15°
